

Study of radiative kaon decays and ChPT tests at NA48/2

Stefano Venditti

University of Pisa & INFN
On Behalf of the NA48/2 collaboration

The latest results from the NA48/2 collaboration on charged kaon decays will be reviewed. The high statistics available, collected during 2003 and 2004 runs, allows the study of charged kaon decays up to branching ratios of $\sim 10^{-8}$. The status of the analyses of several radiative decays (among which $K^\pm \rightarrow \pi^\pm \pi^0 \gamma$, $K^\pm \rightarrow \pi^\pm \gamma \gamma$, $K^\pm \rightarrow \pi^\pm e^+ e^- \gamma$ and $K^\pm \rightarrow \pi^\pm e^+ e^-$) will be discussed, including BR measurements and possible ChPT and CPV tests.
