

Deuteron-proton elastic scattering at 1.25 GeV/u

P.K.Kurilkin^(a) for the HADES-collaboration

^(a) Joint Institute for Nuclear Research

The preliminary results on the differential cross section in dp- elastic scattering has been obtained at 1.25 GeV/u with the HADES spectrometer over large angular range in the c.m. The obtained data correspond to the large transverse momenta, where the sensitivity to the 2N and 3N short range correlations is expected.
