Motivation

- The number of predicted states is much more than that observed

“missing” baryon states : non-existence / to be observed ?

$$\pi N \text{ and } \gamma N$$

$$NN \text{ and } \bar{N}N$$

- The properties of Roper resonance

the existence is well established:

four-star ranking in the particle data book

mass and width have rather large uncertainties and a large difference between BW and pole results

3-quark state? dynamically generated? breathing mode?

Motivation

$N^*(1440)$ resonance in the $pp \rightarrow pn\pi^+$

$\sqrt{s}=1.3\text{GeV}$

Summary

- Among 3 major ingredients, double- Δ , $N^*(1440) \rightarrow \Delta\pi$ and $N^*(1440) \rightarrow N\sigma$ terms, considered in the Valencia model, our model increases significantly the relative contribution from the term $N^*(1440) \rightarrow N\sigma$ by reducing the relative branching ratio of $N^*(1440) \rightarrow \Delta\pi$ and assuming a smaller cut-off parameter for the $\pi N\Delta$ vertex.
- Our model introduces significant contributions from $\Delta \rightarrow N\pi \rightarrow N\pi\pi$ at energies near threshold and from $\Delta^*(1600)$ and $\Delta^*(1620)$ at energies above 1.5 GeV
