A.W. Thomas & W. Bentz

Outlook

- ❖ Motivation
- ❖ Strange NJL-jet: Distribution & Fragmentation Functions
- ❖ Monte-Carlo simulations and inclusion of p_\perp

Hadron Structure with SIDIS

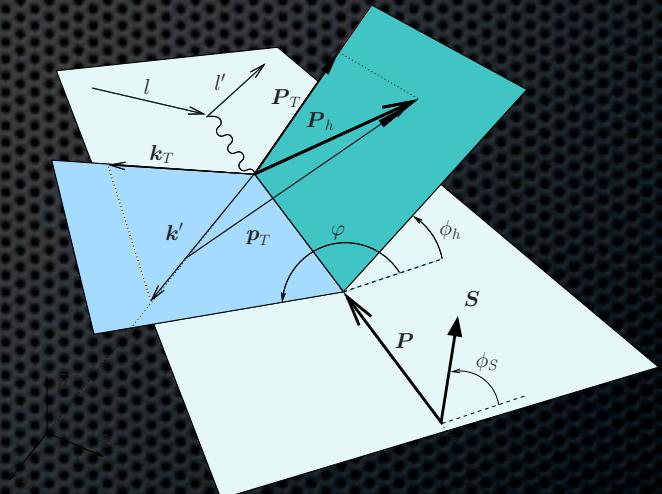

A. Kotzinian, Nucl. Phys. B441, 234 (1995).

- Semi-inclusive deep inelastic scattering (SIDIS): $e N \rightarrow e h X$
- Cross-section factorizes into parton distribution and fragmentation functions.

Access to hadron structure:

- Ex., unpolarized cross section is ~

$$\sum_q e_q^2 \int d^2 k_\perp f_1^q(x, k_\perp) \pi y^2 \frac{\hat{s}^2 + \hat{u}^2}{Q^4} D_q^h(z, p_\perp)$$

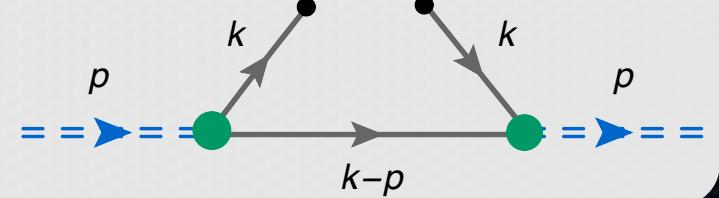

- NJL provides a sound framework for calculating both!

Distribution and Fragmentation

Ito et al. Phys.Rev.D80:074008,2009

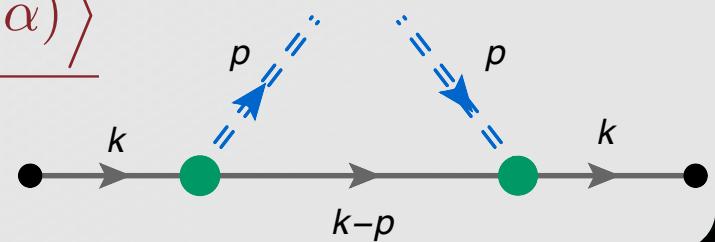

Probability of finding quark $q(x)$ in hadron h :

$$f_q^h(x) = p_- \int d^2 k_T \sum_{\alpha} \frac{\langle p | b_{\alpha}^\dagger(p) b_{\alpha}(p) | p \rangle}{\langle p | p \rangle}$$
$$x = k_- / p_-$$

Probability of finding hadrons $h(z)$ in cloud of q :

$$D_q^h(z) = \frac{1}{6} dp_- \int d^2 p_{\perp} \sum_{\alpha} \frac{\langle k(\alpha) | a_h^\dagger(p) a_h(p) | k(\alpha) \rangle}{\langle k(\alpha) | k(\alpha) \rangle}$$
$$z = p_- / k_-$$

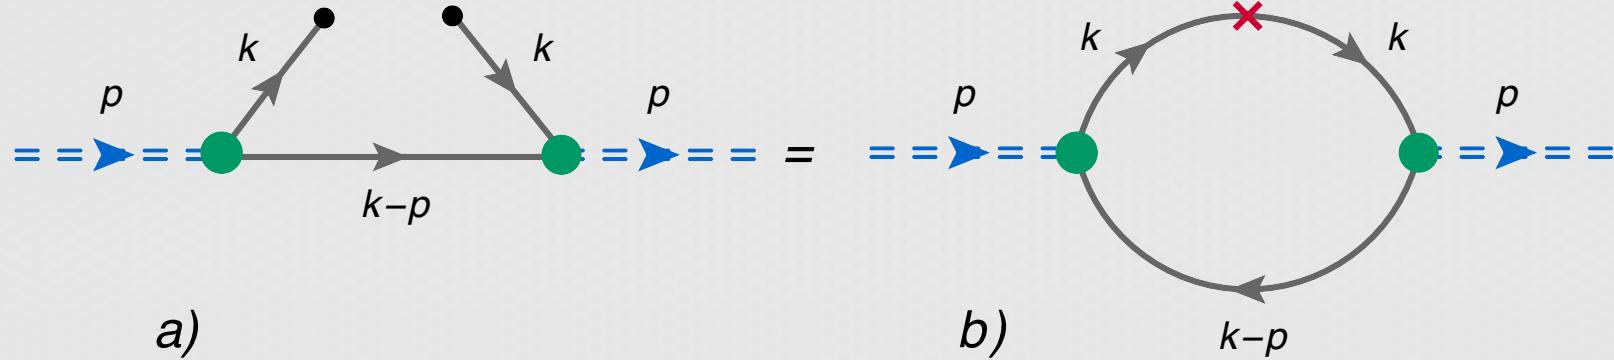

Motivation

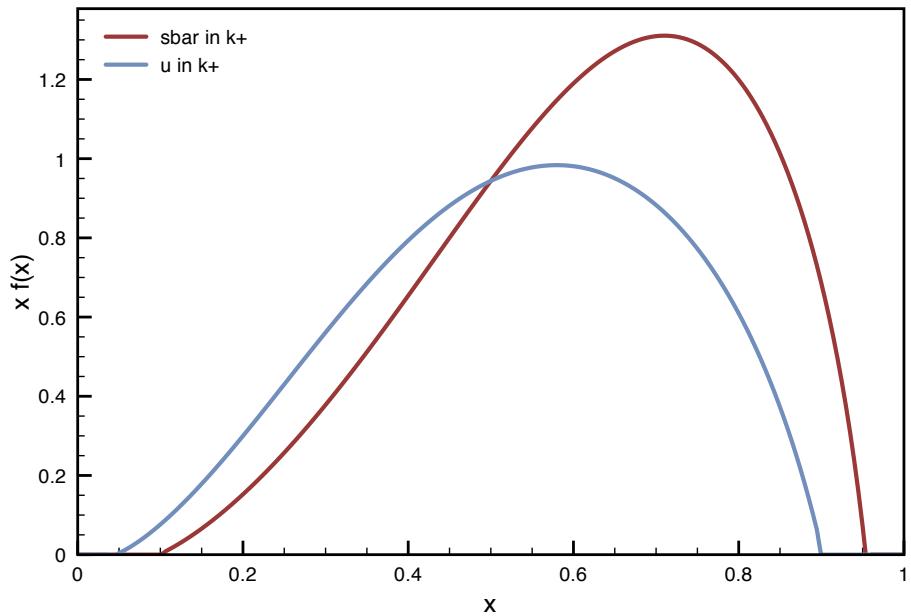

- ▣ Effective quark model descriptions of fragmentation functions usually employ “elementary” one-step process.
- ▣ The resulting fragmentation functions are too small compared to data (e.g. M. Hirai et al: PRD 75 (2007) 094009.).
- ▣ Multiple hadron emission is mimicked by introducing “normalization factors”.

K Distribution Function in NJL

Bentz et al.: Nucl.Phys.A651:143-173,1999.

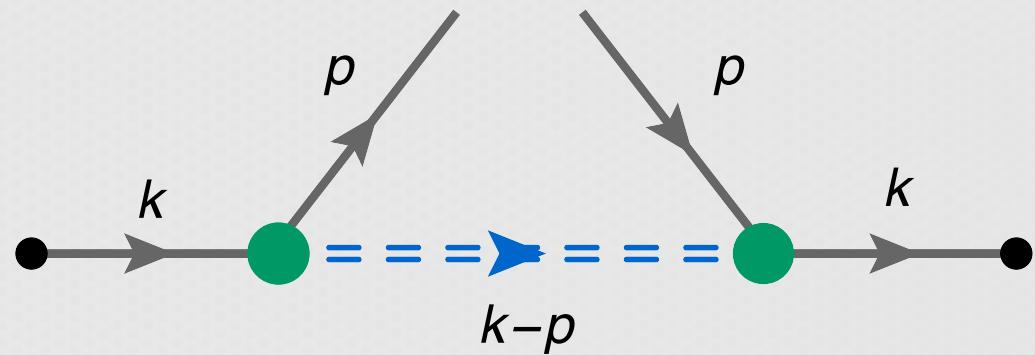

- Regularization:
Lepage-Brodsky (LB)
Invariant Mass Cutoff

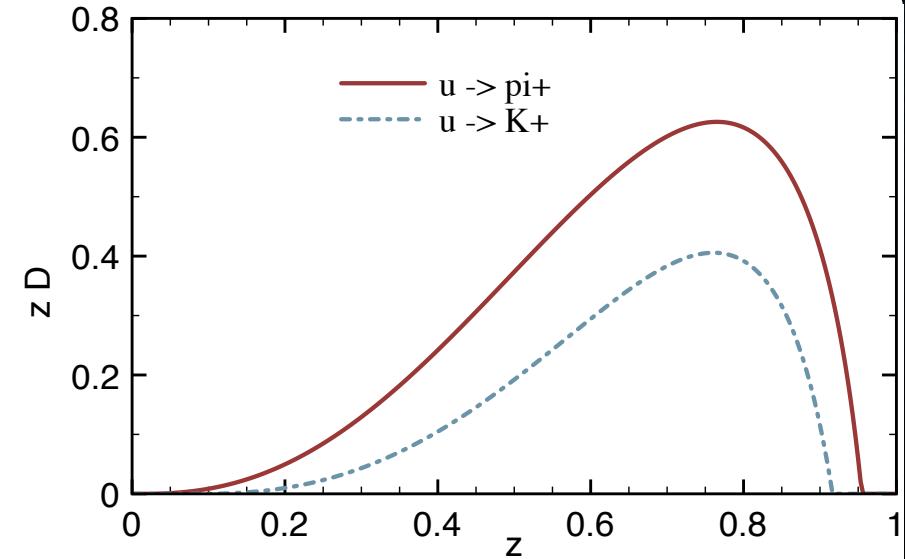

Splitting Functions

- One-quark truncation of the wavefunction:

$$d_q^m(z) : q \rightarrow Qm$$
$$m = q\bar{Q}$$

$$u \rightarrow d\pi^+$$
$$u \rightarrow sk^+$$

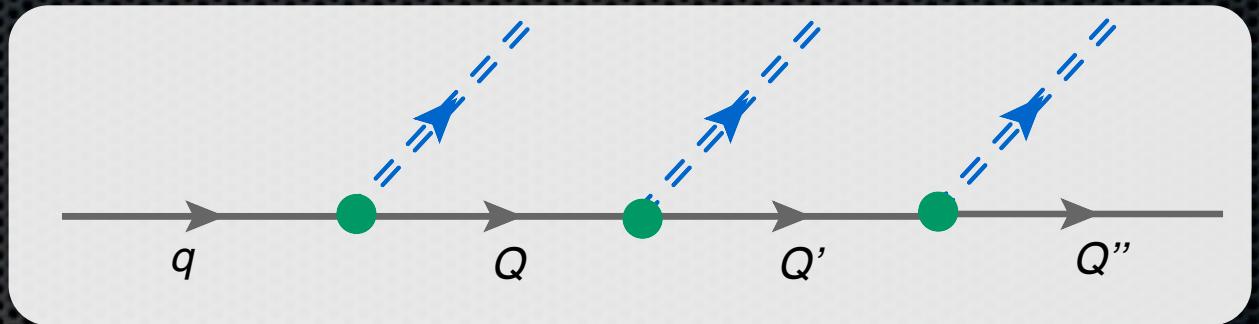

NJL-jet Model for Fragmentation Function

Field, Feynman.Nucl.Phys.B136:1,1978.

- Chain Decay:

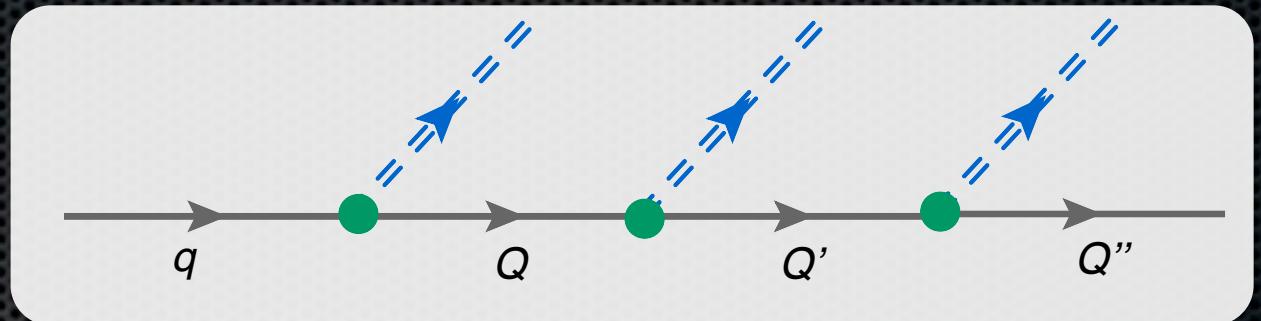

No re-absorption

$$D_q^m(z) = \hat{d}_q^m(z) + \int_z^1 \frac{dy}{y} \hat{d}_q^Q\left(\frac{z}{y}\right) \cdot D_Q^m(y)$$

$$\hat{d}_q^m(z) = \hat{d}_q^{Q'}(1-z)|_{m=\bar{Q}' q}$$

Probabilistic Interpretation of Integral Equation

The probability of finding mesons m with mom. fraction z in a jet of quark q

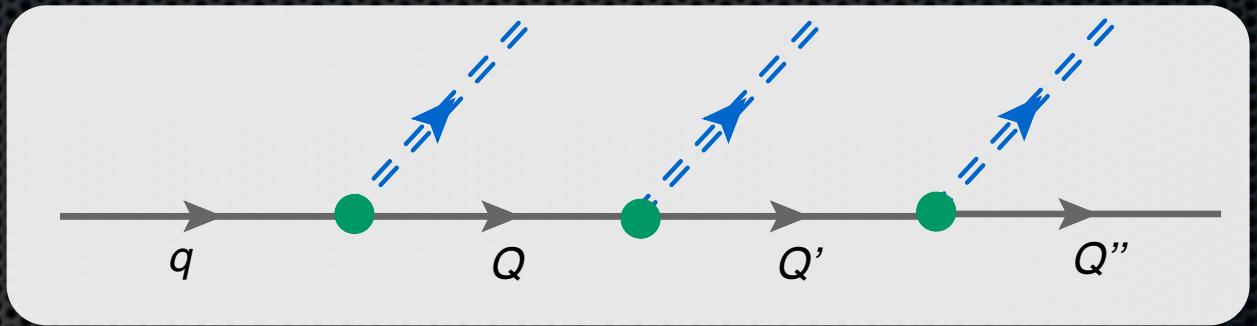

$$D_q^m(z)dz = \hat{d}_q^m(z)dz + \int_z^1 \hat{d}_q^Q(y)dy \cdot D_Q^m\left(\frac{z}{y}\right) \frac{dz}{y}$$

Probability of emitting the meson at link 1

Probability that Momentum fraction y is transferred to jet at step 1

The probability scales with mom. fraction

Probabilistic Interpretation of Integral Equation

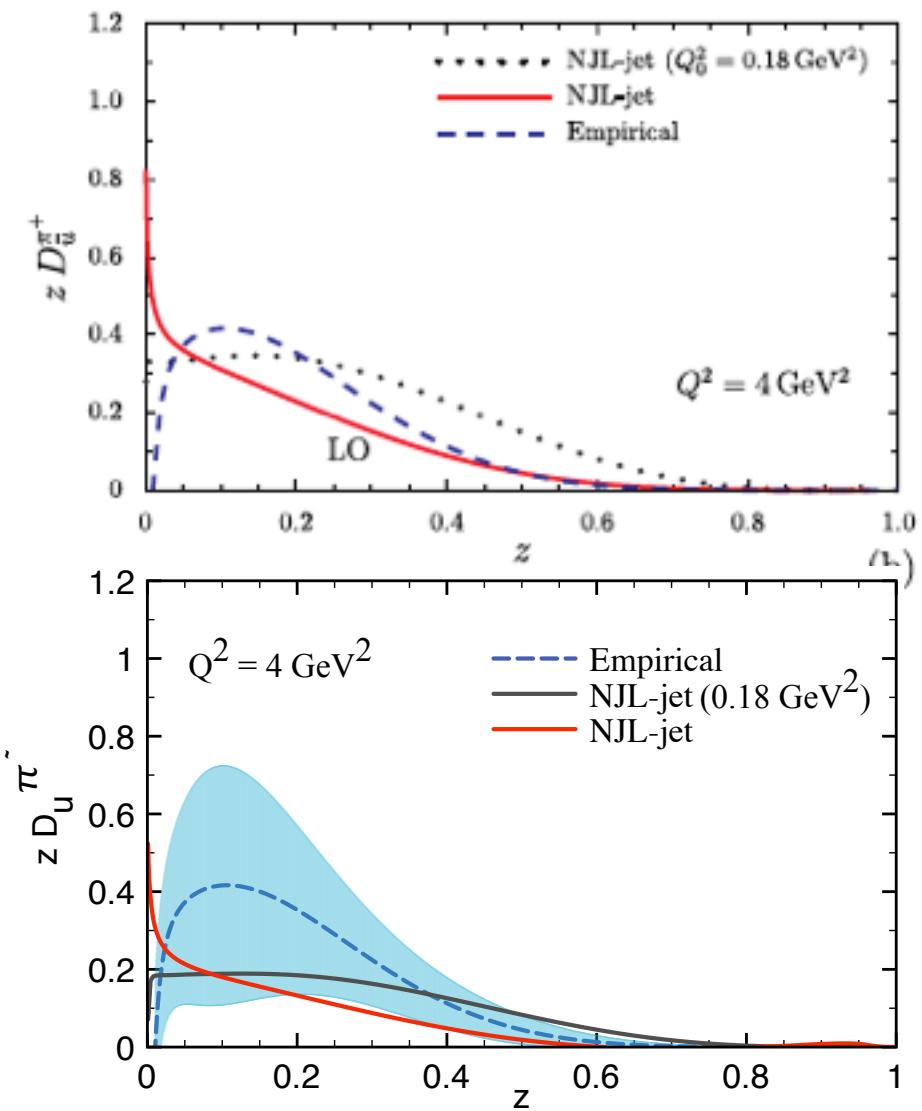

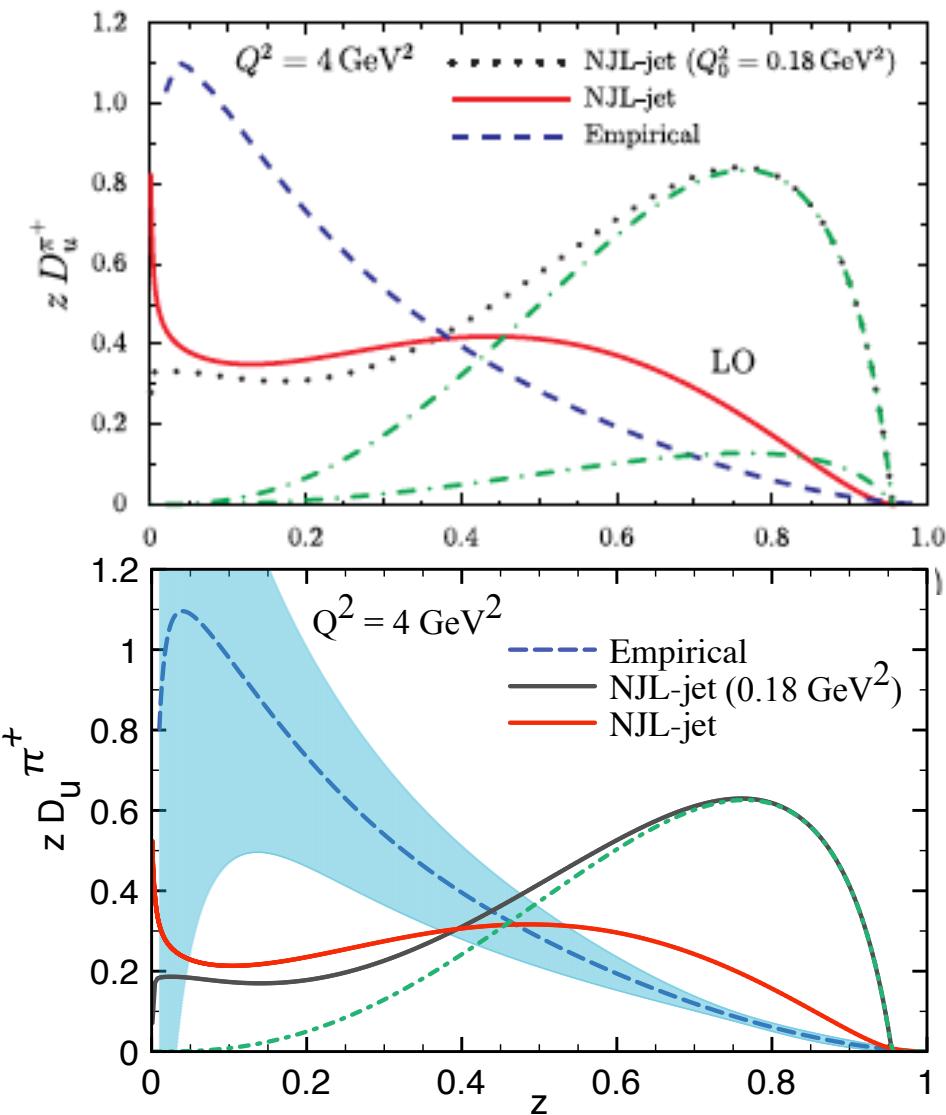

$$D_q^m(z) = \hat{d}_q^m(z) + \int_z^1 \frac{dy}{y} \hat{d}_q^Q\left(\frac{z}{y}\right) \cdot D_Q^m(y)$$

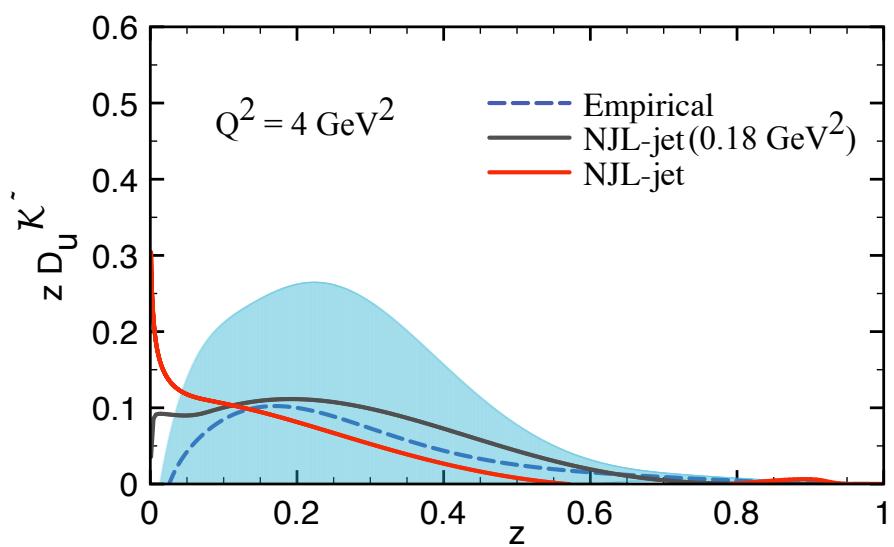

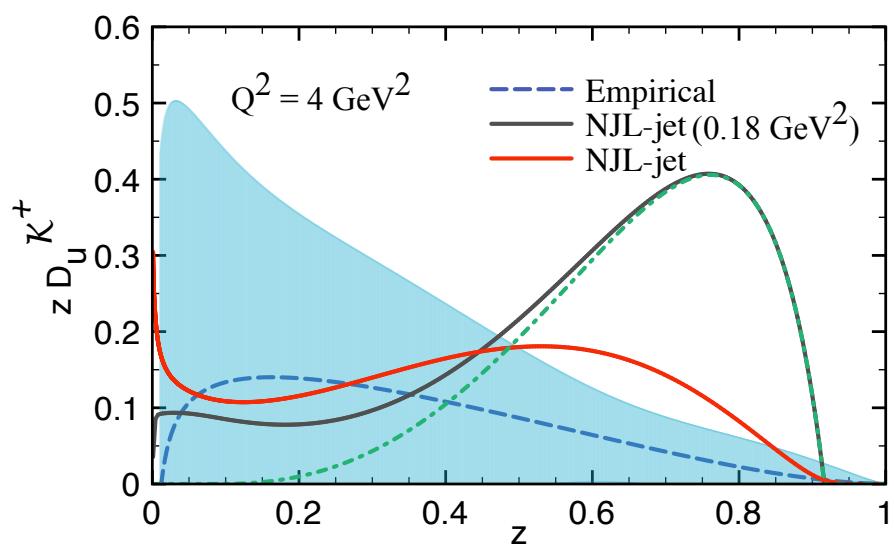

$$\hat{d}_q^m(z) = \hat{d}_q^{Q'}(1-z)|_{m=\bar{Q}'q}$$

Strangeness Effect in Pion

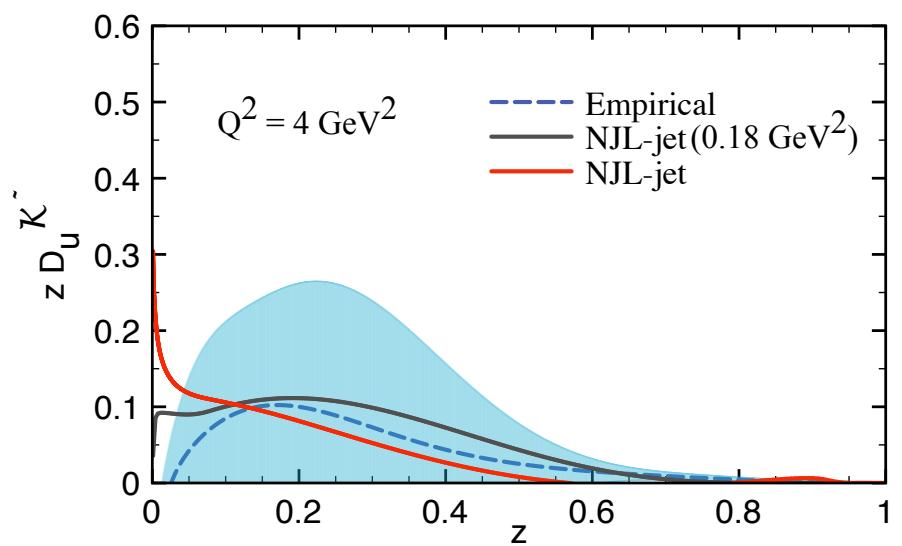

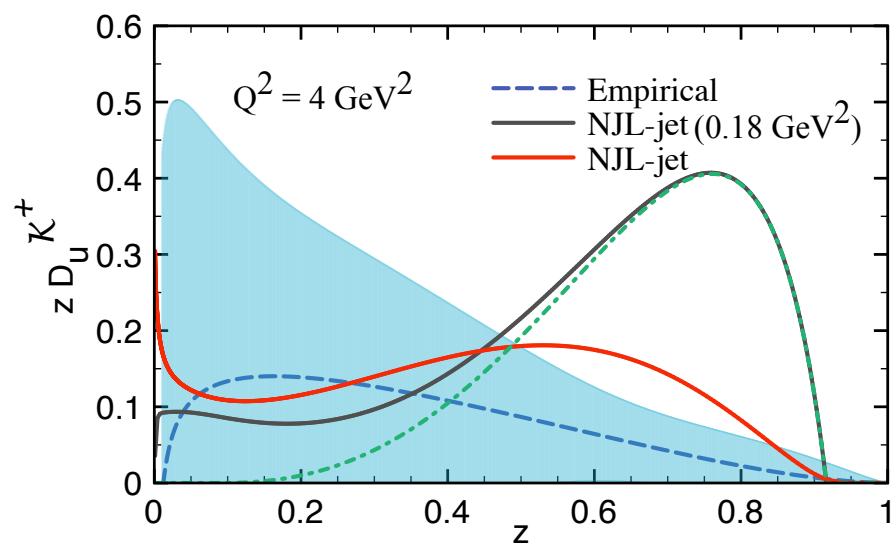

Ito et al. Phys.Rev.D80:074008,2009

Results for Kaon

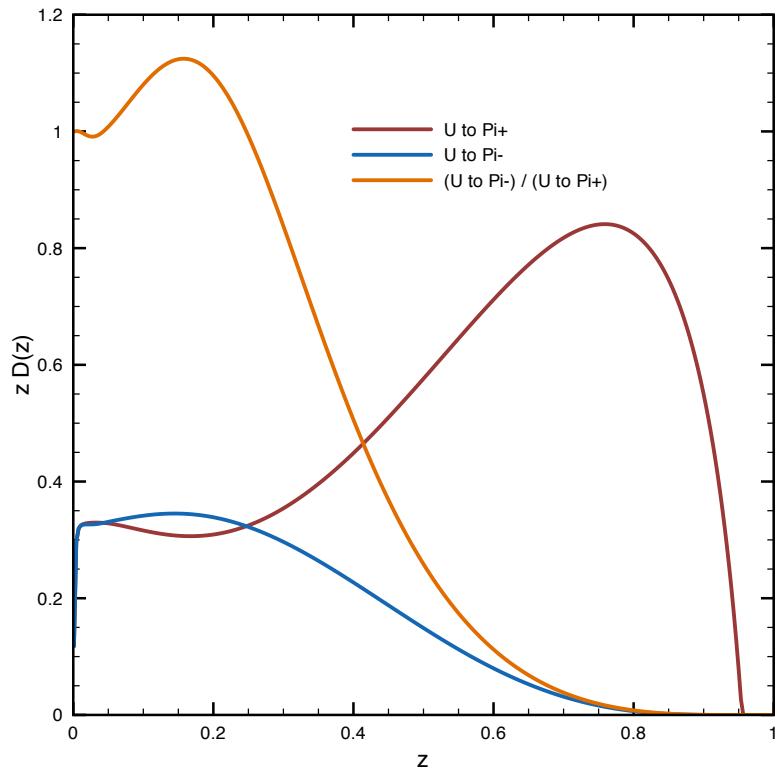

Results for Kaon

Momentum and Isospin Sum Rules Satisfied!

Unfavored to Favored Ratio

Monte-Carlo (MC) Simulations

- Simulate decay chains to extract probabilities
- Allows for inclusion of p_{\perp}
- Numerically trivially parallelizable (MPI, GPGPU)

Fragmentations from MC

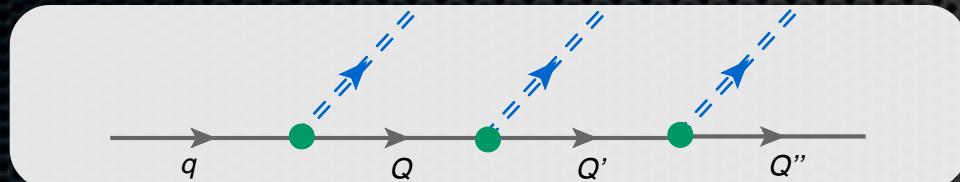

- Assume Cascade process:

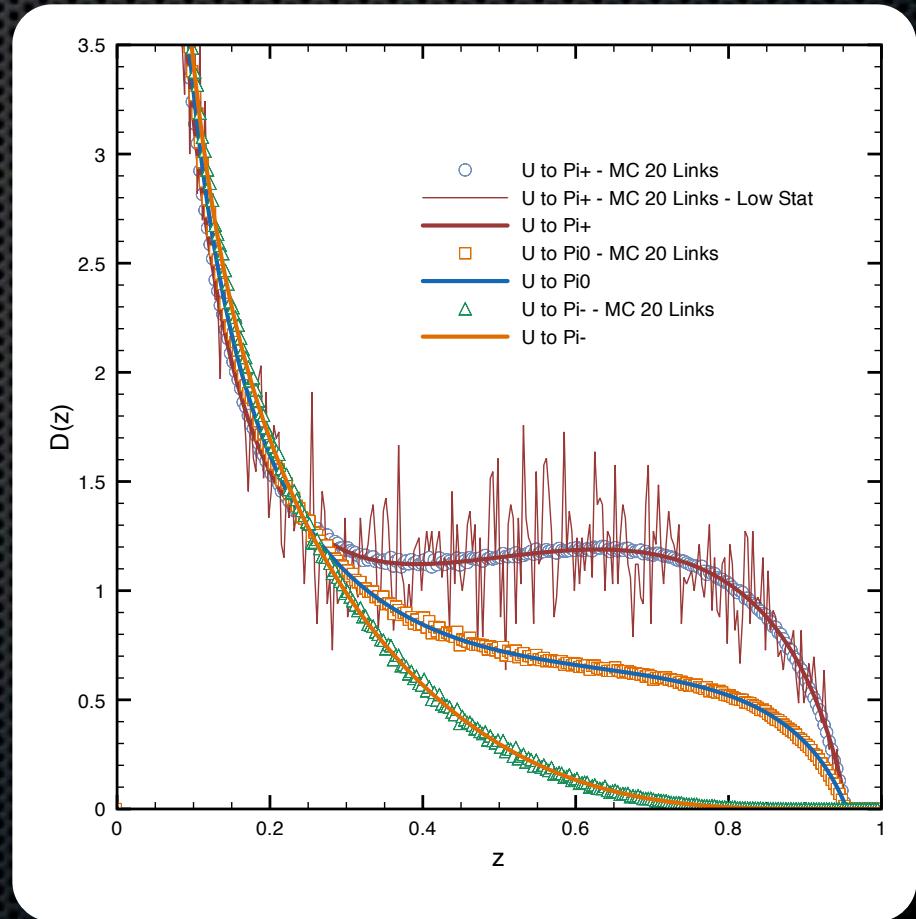

- Randomly sample z from input splittings.
- Evolve to sufficiently large number of decay links.
- Repeat for decay chains with the same initial quark.

Fragmentations from MC

- Assume Cascade process:

- Randomly sample z from input splittings.
- Evolve to sufficiently large number of decay links.
- Repeat for decay chains with the same initial quark.

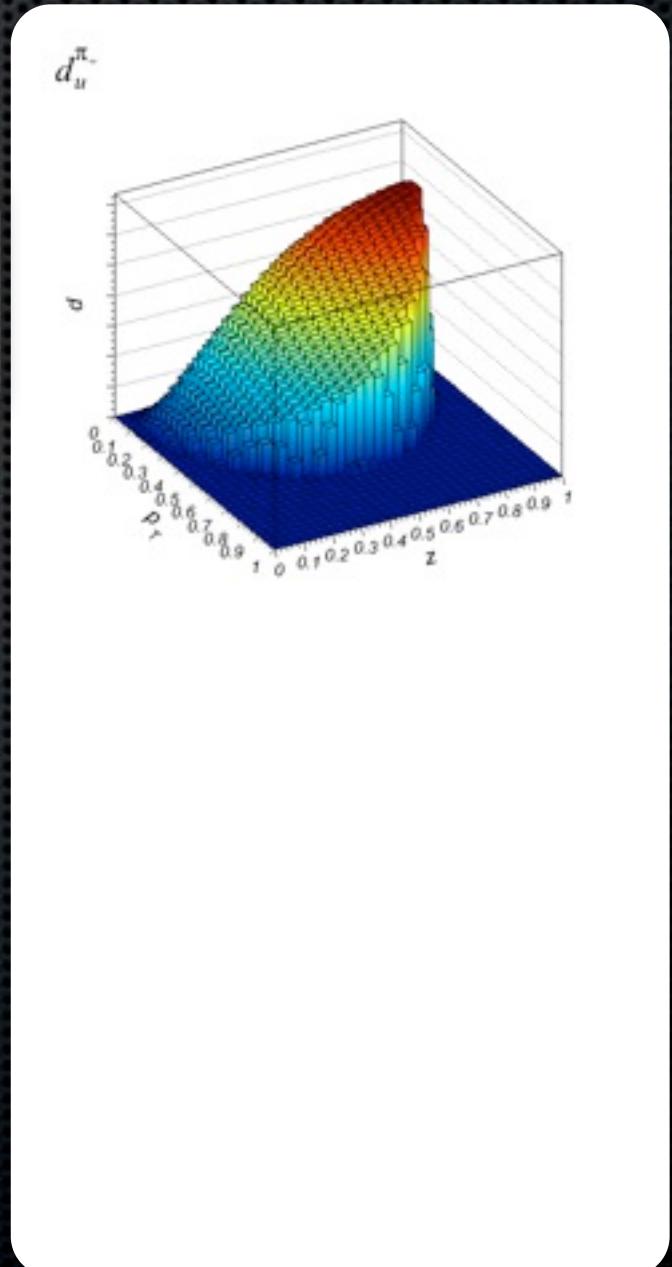

Including Transverse Momenta

- p_\perp -dependent splittings: $d_q^m(z, p_\perp)$

$$\frac{C_I}{2} g_{mqq}^2 z \frac{p_\perp^2 + ((z-1)M_1 + M_2)^2}{(p_\perp^2 + z(z-1)M_1^2 + zM_2^2 + (1-z)m_m^2)^2}.$$

- Conserve transverse momenta at each link.

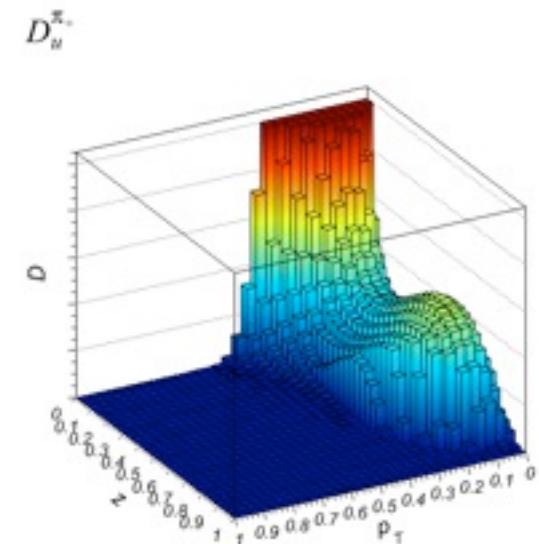

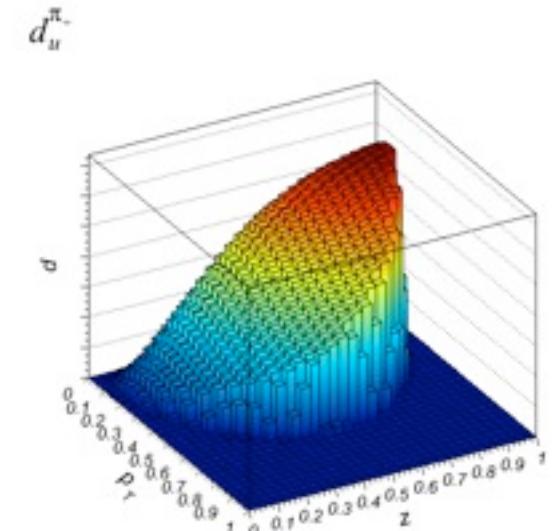

Including Transverse Momenta

- p_\perp -dependent splittings: $d_q^m(z, p_\perp)$

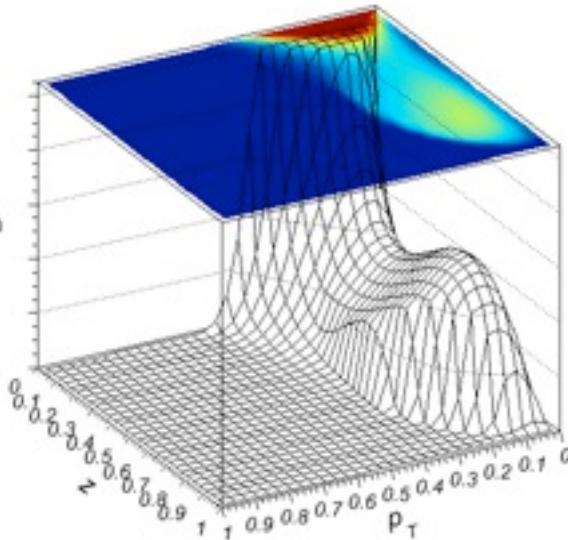

$$\frac{C_I}{2} g_{mqq}^2 z \frac{p_\perp^2 + ((z-1)M_1 + M_2)^2}{(p_\perp^2 + z(z-1)M_1^2 + zM_2^2 + (1-z)m_m^2)^2}.$$

- Conserve transverse momenta at each link.

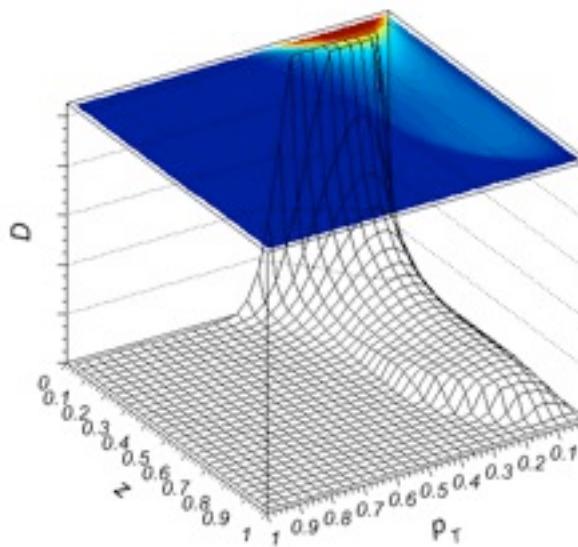

More Results with p_\perp

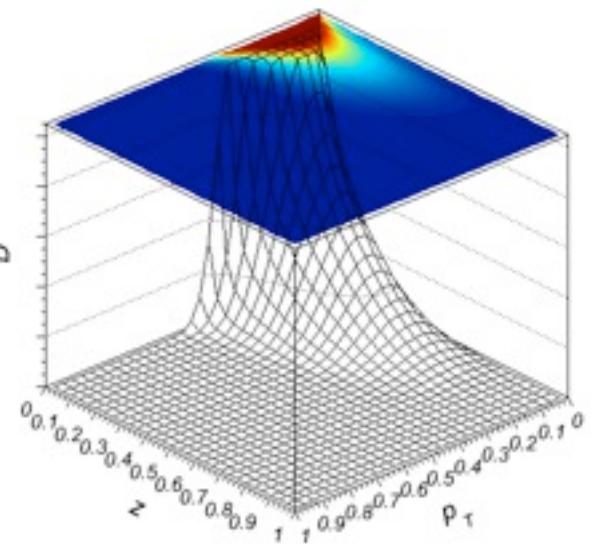

$D_u^{\pi_+}$

$D_u^{\pi_0}$

D_u^π

Outlook

- ▣ NJL-jet model: coupled channel cascade description of fragmentation function.
- ▣ Preliminary results: qualitative agreement with empirical parametrizations of experimental data.
- ▣ Improvements: Include vector mesons and baryons in fragmentation process, NLO DGLAP evolution.
- ▣ Improvements in MC.
- ▣ Polarized Fragmentation Functions
