
Theory of Two-Pion Photo- and Electroproduction off the Nucleon

Helmut Haberzettl

Institute for Nuclear Studies and Department of Physics

THE GEORGE WASHINGTON UNIVERSITY

WASHINGTON DC

Collaborator: Kanzo Nakayama, University of Georgia

Motivation

- Two-pion production $\gamma N \rightarrow \pi\pi N$ is being measured now
- No comprehensive formulation of two-pion photoproduction processes exists that is at the same level of rigor as single-pion production

Procedure

- Use field theory based on hadronic Lagrangians
- Employ LSZ-type mechanisms to couple electromagnetic field to fully dressed hadronic propagators and vertices

NB: The formulation given here can be easily translated to any type of mesons

First, something simple. . .

Single-pion Production

Basic Hadronic Two-pion Production Processes

Attach photon to πNN vertex:

- Simple at tree level
- Very complicated for *dressed* vertex

Pions, Nucleons, and Photons

$\pi N T$ matrix

dressed nucleon propagator

propagator determines current

dressed πNN vertex

■ Tower of *nonlinear* Dyson-Schwinger-type equations

Pion Photoproduction

■ Pion-production current M^μ :

■ Nucleon current J^μ :

⇒ The internal structures of the dressed nucleon current can be understood by the dynamics of the pion production current.

■ Tower of *nonlinear* Dyson-Schwinger-type equations

Gauge Invariance: Generalized Ward–Takahashi Identity

$$M^\mu = M_s^\mu + M_u^\mu + M_t^\mu + M_{\text{int}}^\mu$$

■ Generalized WTI for the full current M^μ :

$$k_\mu M^\mu = -F_s S(p+k) Q_i S^{-1}(p) + S^{-1}(p') Q_f S(p'-k) F_u + \Delta_\pi^{-1}(q) Q_\pi \Delta_\pi(q-k) F_t$$

Off-shell constraint!

Hadrons on-shell: $k_\mu M^\mu = 0$

Gauge Invariance: Generalized Ward–Takahashi Identity

$$M^\mu = M_s^\mu + M_u^\mu + M_t^\mu + M_{\text{int}}^\mu$$

■ Generalized WTI for the full current M^μ :

$$k_\mu M^\mu = -F_s S(p+k) Q_i S^{-1}(p) + S^{-1}(p') Q_f S(p'-k) F_u + \Delta_\pi^{-1}(q) Q_\pi \Delta_\pi(q-k) F_t$$

Approximations destroy gauge invariance!

Rewriting the Production Current

■ Pion-production current M^μ :

 \end{array}$$

■ Tower of *nonlinear* Dyson-Schwinger-type equations

Problems?

- Everything is exact!
- Everything is nonlinear!
- Everything is hideously complicated!

Let's cut the Gordian knot!

$$\text{M} = \text{---} + \text{B} + \text{X} + \text{B}_T \quad (\text{a})$$

(Note: A grey diagonal line is drawn over this equation, indicating it is to be discarded.)

$$\text{M} = \text{---} + \text{B} + \text{T} + \text{B}_T \quad (\text{b})$$

(Note: A yellow smiley face is placed under the second term in the sum.)

$$\text{B} = \text{---} + \text{---} + \text{---} \quad (\text{c})$$

(Note: A yellow smiley face is placed under the third term in the sum.)

Do not use X .
Work with full T .

$$\text{---} = \text{---} + \text{U} + \text{U} + \text{L} + \text{U} + \text{L} + \text{---}$$

$$\text{---} = \text{---} + \text{---} + \text{---} + \text{---} + \text{---} \quad (\text{a})$$

$$\text{---} = \text{---} + \text{---} + \text{---} + \text{---} + \text{---} \quad (\text{b})$$

 M_c^μ

■ Lowest-order approximation in terms of phenomenological form factors:

$$\begin{aligned}
 M_c^\mu = & ge\gamma_5 \frac{i\sigma^{\mu\nu}k_\nu}{4m^2} \tilde{\kappa}_N - (1-\lambda)g \frac{\gamma_5\gamma^\mu}{2m} \tilde{F}_t e_\pi - G_\lambda \left[e_i \frac{(2p+k)^\mu}{s-p^2} (\tilde{F}_s - \hat{F}) \right. \\
 & + e_f \frac{(2p'-k)^\mu}{u-p'^2} (\tilde{F}_u - \hat{F}) \\
 & \left. + e_\pi \frac{(2q-k)^\mu}{t-q^2} (\tilde{F}_t - \hat{F}) \right]
 \end{aligned}$$

Don't try to read the details. What is important is that this is a simple expression, easy to evaluate, and that it helps preserve gauge invariance of the entire production current.

$$\text{M} = \text{quark-antiquark} + \text{B} + \text{X} + \text{B}_T \quad (\text{a})$$

$$\text{M} = \text{quark-antiquark} + \text{B} + \text{T} + \text{B}_T \quad (\text{b})$$

$$\text{B} = \text{quark-antiquark} + \text{quark} + \text{quark} + \text{B}_T \quad (\text{c})$$

 M_c^μ

■ Lowest-order approximation in terms of phenomenological form factors:

$$M_c^\mu = ge\gamma_5 \frac{i\sigma^{\mu\nu}k_\nu}{4m^2} \tilde{\kappa}_N - (1-\lambda)g \frac{\gamma_5 \gamma^\mu}{2m} \tilde{F}_t e_\pi - G_\lambda \left[e_i \frac{(2p+k)^\mu}{s-p^2} (\tilde{F}_s - \hat{F}) + e_f \frac{(2p'-k)^\mu}{u-p'^2} (\tilde{F}_u - \hat{F}) + e_\pi \frac{(2q-k)^\mu}{t-q^2} (\tilde{F}_t - \hat{F}) \right]$$

Don't try to read the details. What is important is that this is a simple expression, easy to evaluate, and that it helps preserve gauge invariance of the entire production current.

Approximation can be made more sophisticated if necessary...

Does it work? — Yes!

Results for $\gamma N \rightarrow \pi N$

$$\frac{d\sigma}{d\Omega}$$

 Σ  $\gamma p \rightarrow \pi^+ n$  $\gamma p \rightarrow \pi^0 p$  $\gamma n \rightarrow \pi^- p$ 

F. Huang, M. Döring, H. Haberzettl, J. Haidenbauer, C. Hanhart, S. Krewald, U.-G. Meißner, and K. Nakayama, Phys. Rev. C **85**, 054003 (2012)

Now, the real thing...

Two-pion Production

Basic Hadronic Two-pion Production Processes

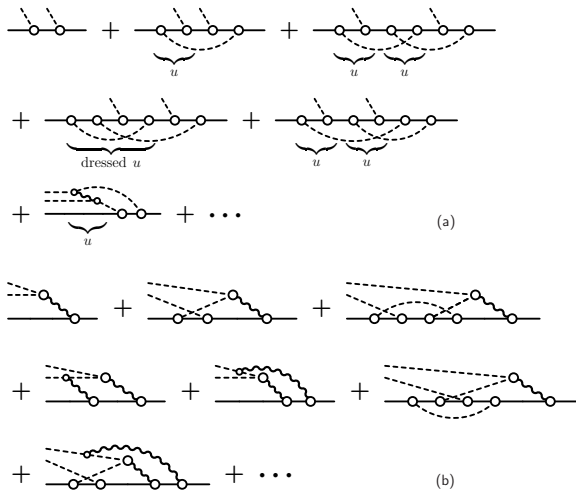

- (a) sequential production off nucleon
- (b) production off intermediate vector meson
- (c) production off intermediate three- or more-pion vertex

Procedure

- (1) Iterate bare hadronic processes and sum up to obtain dressed mechanisms
- (2) Attach photon — employ (gauge-invariant) single-pion amplitudes

Iterated Hadronic Two-pion Production Processes

Lowest orders of
3-body multiple scattering series

Faddeev-type Alt-Grassberger-Sandhas Equations

NP B2, 167 (1967)

$$T_{\beta\alpha} = V_{\beta\alpha} + \sum_{\gamma=1}^3 V_{\beta\gamma} X_{\gamma} T_{\gamma\alpha}$$

$$V_{\beta\alpha} = \bar{\delta}_{\beta\alpha} + \dots$$

$$N_{\beta\alpha} = \bar{\delta}_{\beta\alpha} + \dots$$

$$T_{\beta\alpha} = V_{\beta\alpha} + \sum_{\gamma=1}^3 V_{\beta\gamma} G_0 X_{\gamma} G_0 T_{\gamma\alpha}$$

$$1L_1 = M + \text{diagram}$$

one loop

$$1L_2 = M + \text{diagram} - \text{diagram}$$

$$1L_3 = M + \text{diagram} + \text{diagram}$$

Summary

- ✓ Theory presented provides a complete description of the $\pi\pi$ production process based on field theory. (*This is not a model!* — In principle, the formalism could be implemented to an arbitrary degree of sophistication for any given set of interaction Lagrangians.)
- ✓ Consistent expansion of the two-pion production current in terms of the $\pi\pi N$ Faddeev ordering structure.
- ✓ Full implementation of gauge invariance order by order in terms of *Generalized Ward–Takahashi Identities* at all levels of the reaction dynamics.
⇒ Essential for the microscopic consistency of all reaction mechanisms.
- ✓ Valid for hadronic two- and three-point functions dressed by arbitrary internal mechanisms — even nonlinear ones.
- ✓ Resulting $\pi\pi$ production current can also be written in closed form accounting for full three-body dynamics.
- ✓ Extension beyond one-photon approximation straightforward.
- ✓ Translation to other two-meson production processes straightforward.
