Studies of open charm and charmonium production at LHCb

Giulia Manca\textsuperscript{(a)} on behalf of the LHCb Collaboration

\textsuperscript{(a)} Universita di Cagliari, Cagliari, Italy

The first heavy flavour measurements at LHCb will be about open charm and J/\psi production. Experience on the triggering and reconstruction of such final states during the initial phase of the LHC startup is therefore eagerly awaited. This experience will be reported together with prospects for the full measurements. The first charm hadrons will be reconstructed in the D\textsuperscript{0} \rightarrow K\pi and D\pm \rightarrow K\pi\pi and their inclusive production observed in the forward region covered by LHCb. The inclusive J/\psi production cross section will be measured with the decay mode J/\psi \rightarrow \mu\mu, as a function of the J/\psi pseudo-rapidity $\eta$ and transverse momentum $p_T$, in the region $3 < \eta < 5$ and $p_T < 7$ GeV/c. Contributions of J/\psi from b-hadron decays will be separated from prompt J/\psi produced directly in the $pp$ collisions or in the decays of heavier prompt states. A method to measure the production polarization of the J/\psi will also be presented.
